New in v1.2 · Bank SMS import

Who owes you, and who you owe. One notebook.

A people-first personal finance app I built for Arabic-speaking users: offline-first, bilingual and private by design.

THE PROBLEM

In Egypt, a lot of money moves between people, not categories.

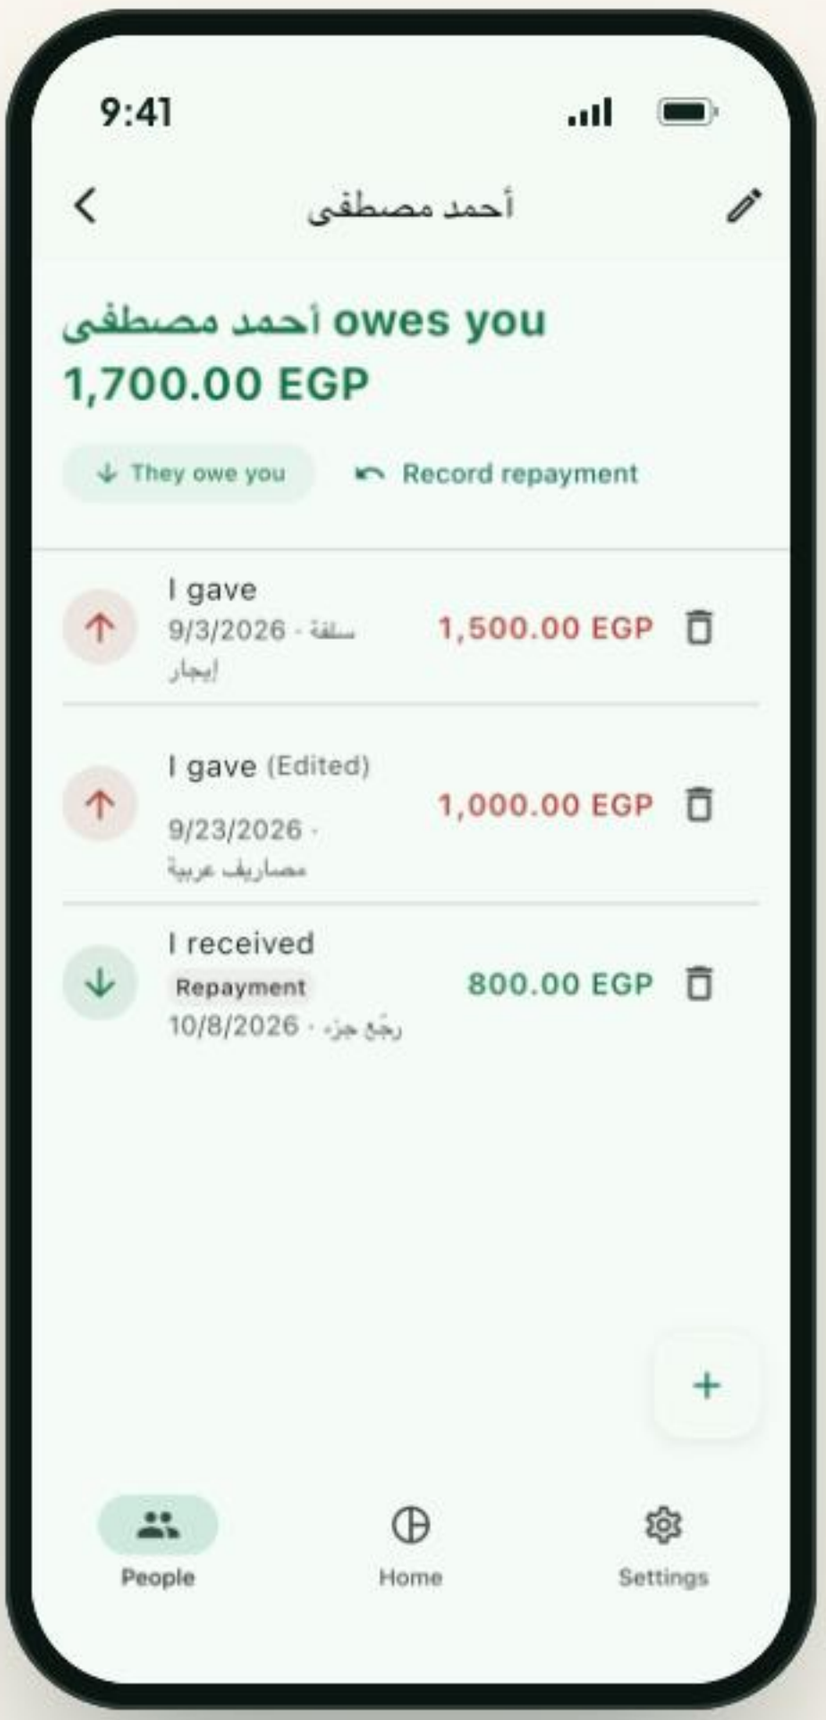

A loan to a friend. Rent a cousin covered. A wedding gift you'll return one day. Most of it lives in people's heads or in a paper *daftar*, and expense trackers don't help because they're built around categories.

A balance per person

“They owe you”, “you owe them” or “settled”, with partial repayments rolled in.

Built for non-accountants

Plain language, calm visuals, no ledger jargon.

Daftary

WHAT'S INSIDE

People first. Then the rest of your money.

People & balances
Two-way running balances and full history

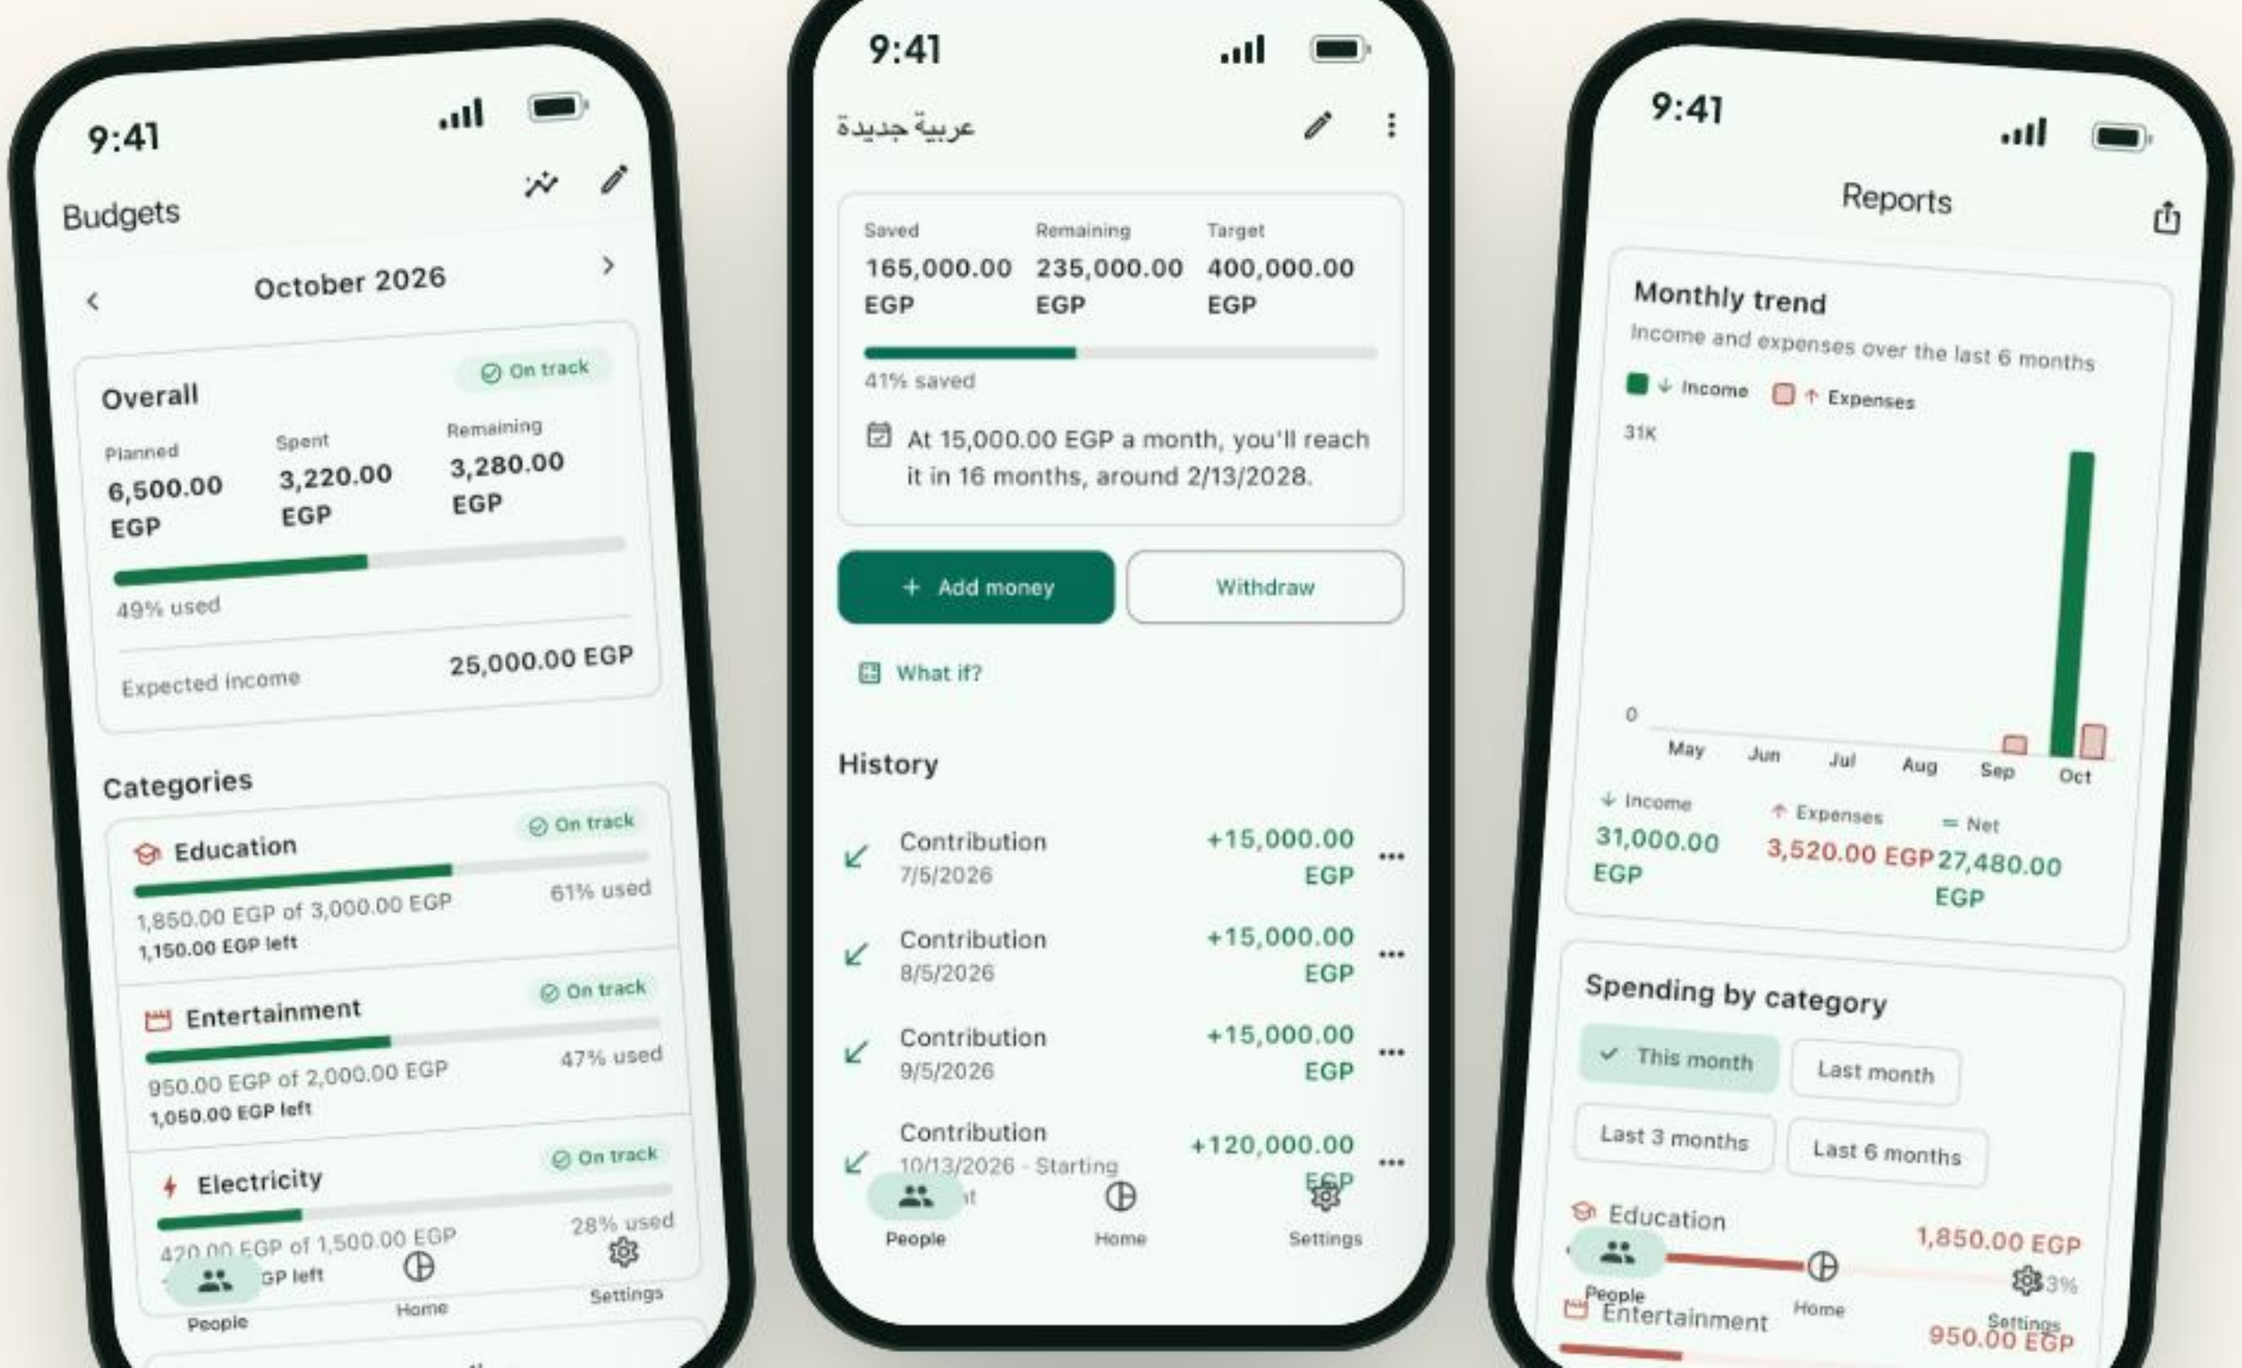

Occasions
Weddings and births: who gave and received what

Budgets
Planned vs. actual, with a monthly trend

Savings goals
Projected dates and a “what if” calculator

Scan paper
On-device OCR turns old notebooks into entries

Bank messages
Bank SMS become entries you review before adding

ARABIC-FIRST

Real right-to-left.
Not a mirrored translation.

Full RTL layouts, Arabic-Indic digit input, light and dark themes, and an optional Liquid Glass UI, all from one Material 3 design system.

العربية · English · Light / Dark · Multi-currency

NEW IN V1.2

Your bank SMS, checked before it counts.

Bank messages become suggested entries. Nothing is saved until you tap Add, and every change to a money record is kept.

Read on your phone

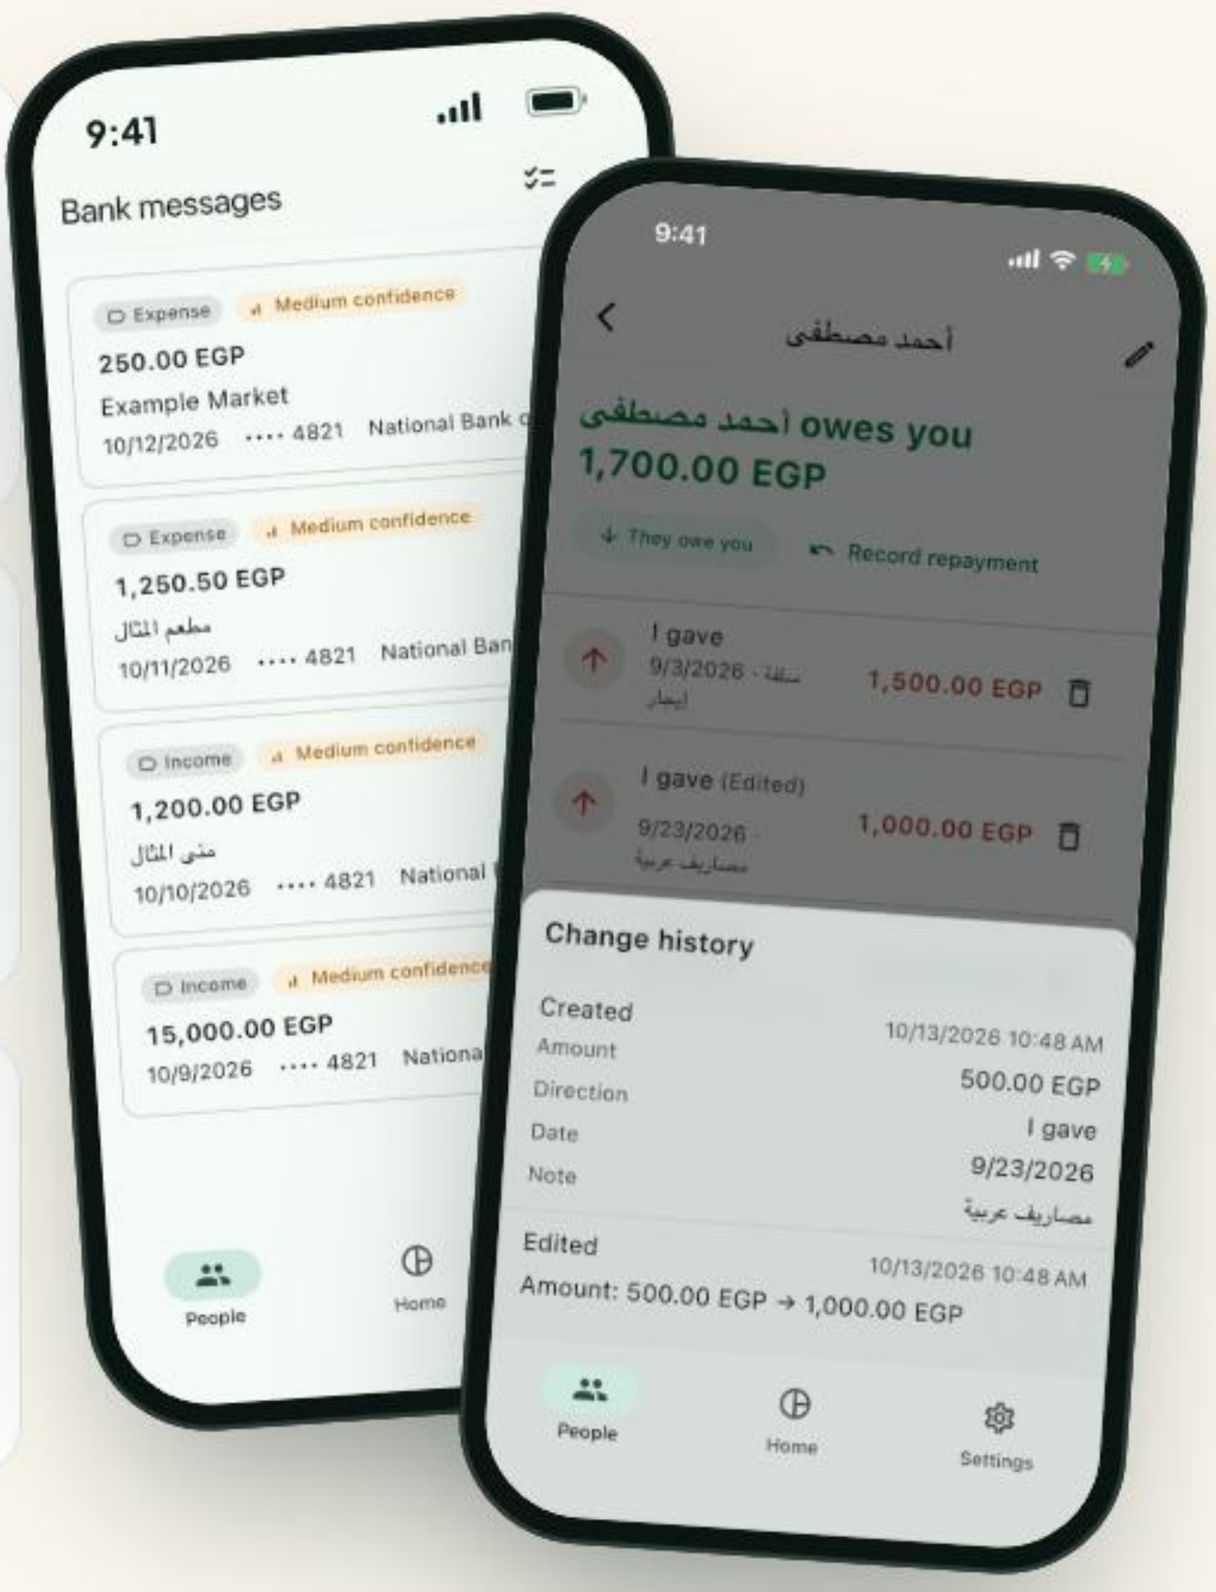

Fixed rules, no AI, no server. Text is masked, encrypted and deleted once you decide.

Change history

See what was edited on any transaction, entry or savings contribution, and when.

Money checks

What's left after a repayment, a confirm for overpaying, and a duplicate warning.

UNDER THE HOOD

Clean Architecture, split by feature.

19 feature modules, each with its own data, domain and presentation layers. Shared infrastructure lives in `lib/core`.

Presentation

Pages · Widgets · Cubits (flutter_bloc) · go_router

Domain

Entities · Use cases · Repository interfaces · pure Dart, fpdart `Either`

Data

Repositories · Drift (SQLite) DAOs · Mappers · Sync outbox

Flutter · Dart 3 · BLoC / Cubit · Drift · SQLite · Supabase · PostgreSQL + RLS · get_it + injectable · go_router · ML Kit · AES-GCM · fl_chart · i18n / RTL · bloc_test · mocktail

ENGINEERING HIGHLIGHTS

Offline-first. Private by default.

Offline-first sync

A local DB is the source of truth. An outbox is written in the same transaction, with revision guards and manual conflict resolution for money records.

App lock

PIN hashed with PBKDF2, biometrics, auto-lock on inactivity and screenshot protection.

Honest money math

Integer minor units plus ISO 4217 currency. A missing rate blocks the total instead of guessing it, and a full accounting audit backs the numbers.

On-device ML

OCR and bank SMS parsing run on the phone, so images and messages never leave it.

19
feature modules

4,000+
automated tests

2
languages, RTL + LTR

TRY IT

Try Daftary on your phone.

Android

Download the APK from GitHub Releases

iPhone

TestFlight beta, coming soon
